Senior Fellow,  
Japan Institute for International Affairs (JIIA)  
nshmr6@gmail.com**

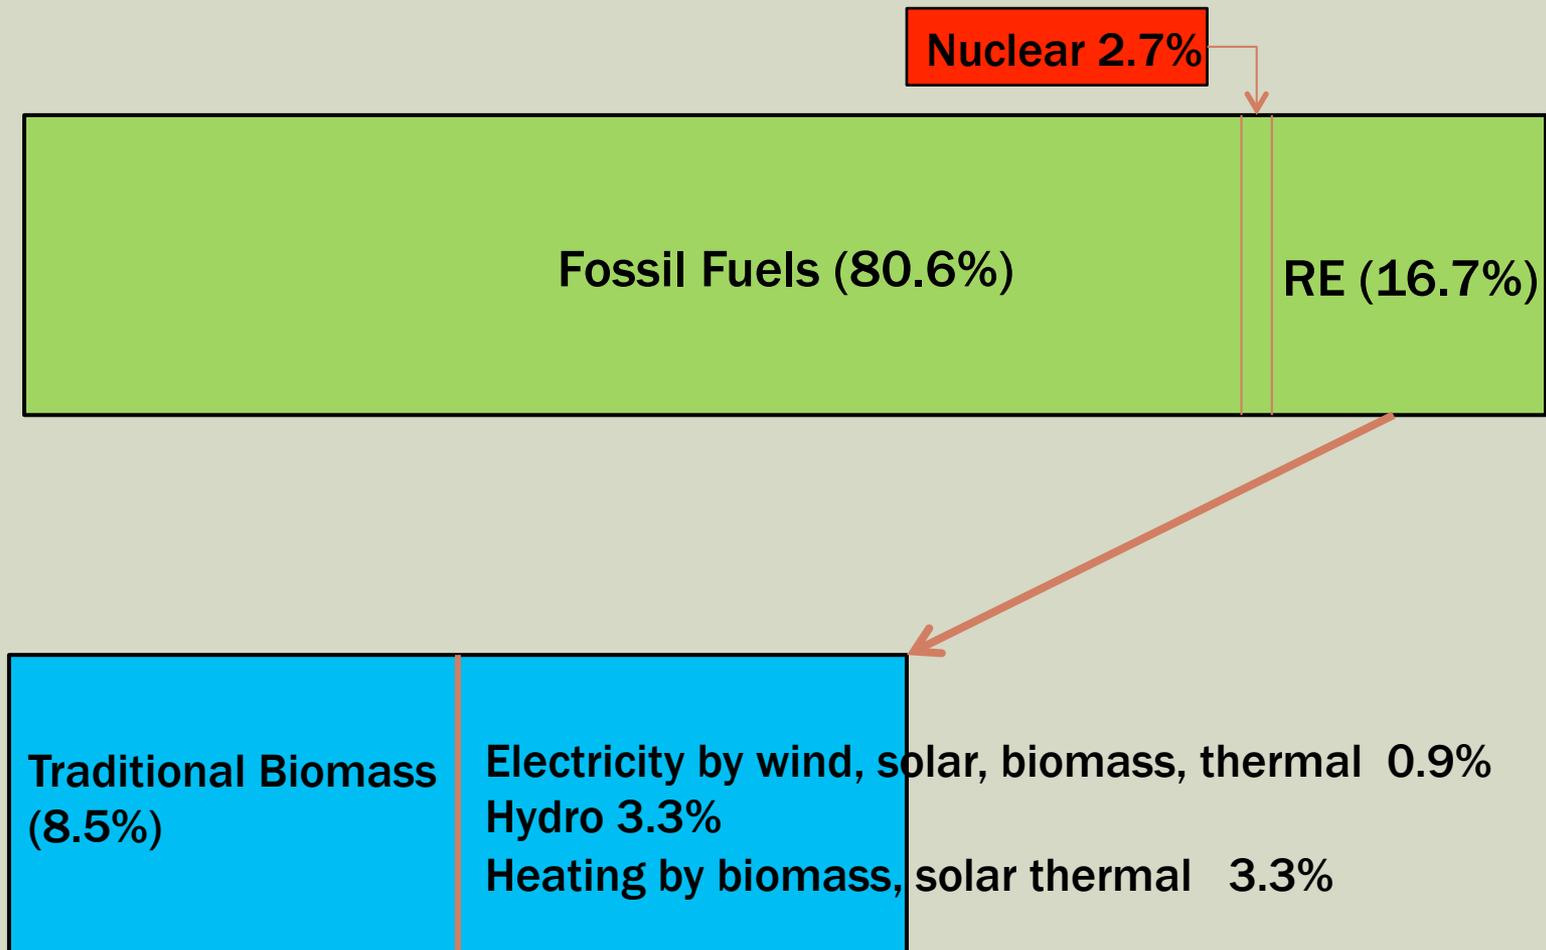

# The Global Energy System 2010 (Mtoe)

RE are still a small part of the global mix of energy...but larger than nuclear...

Figure 2.8 ▶ The global energy system, 2010 (Mtoe)

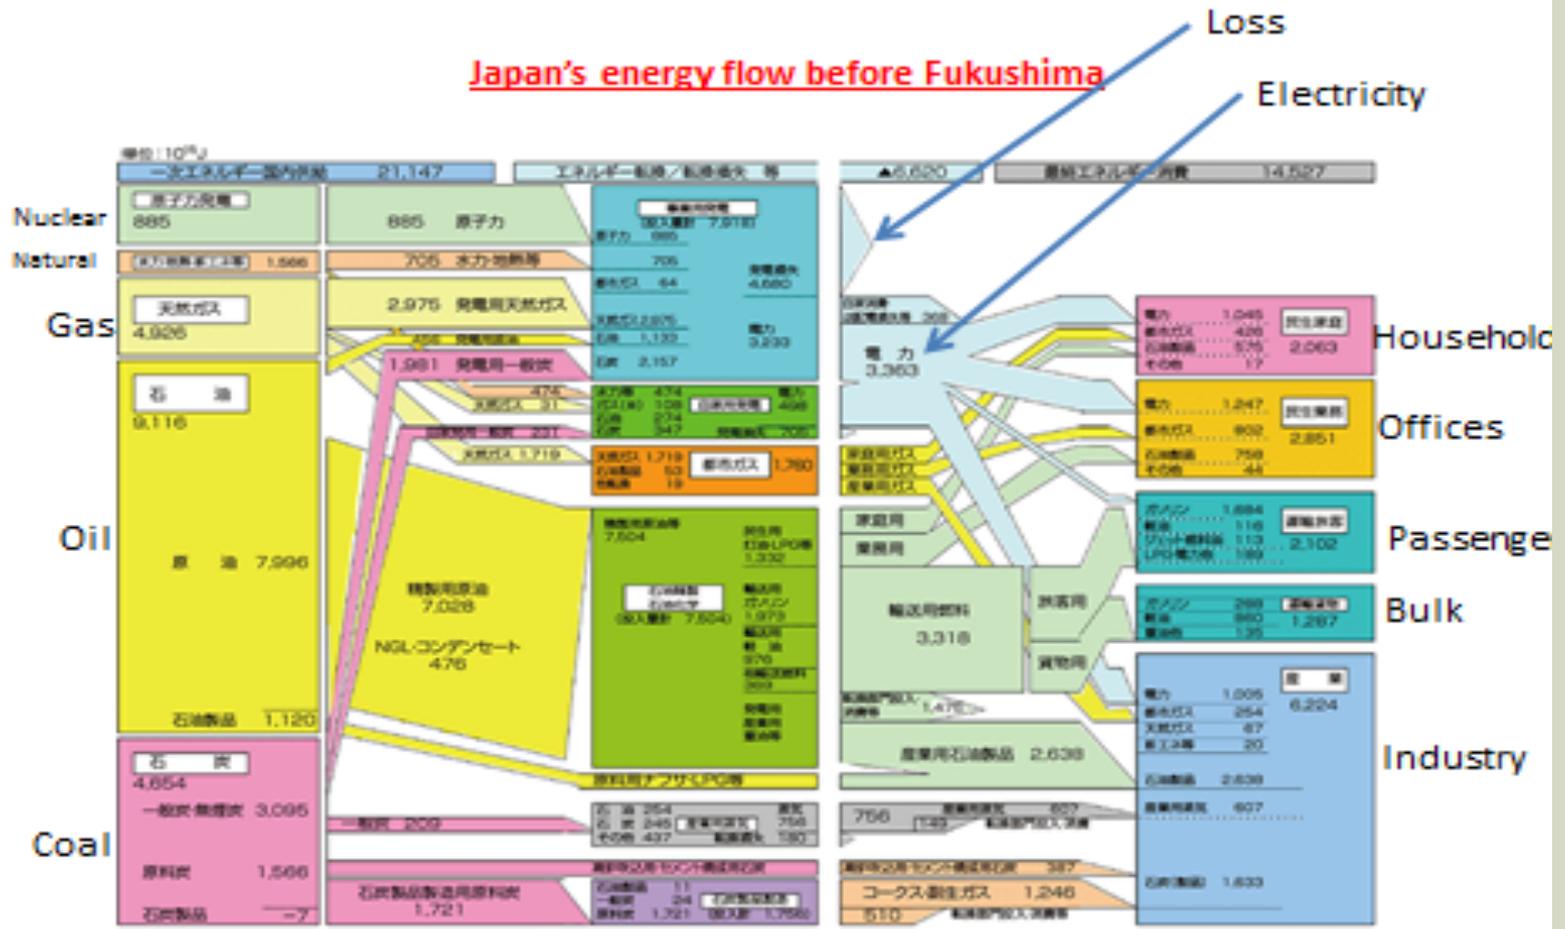

# Global Final Energy Consumption 2010

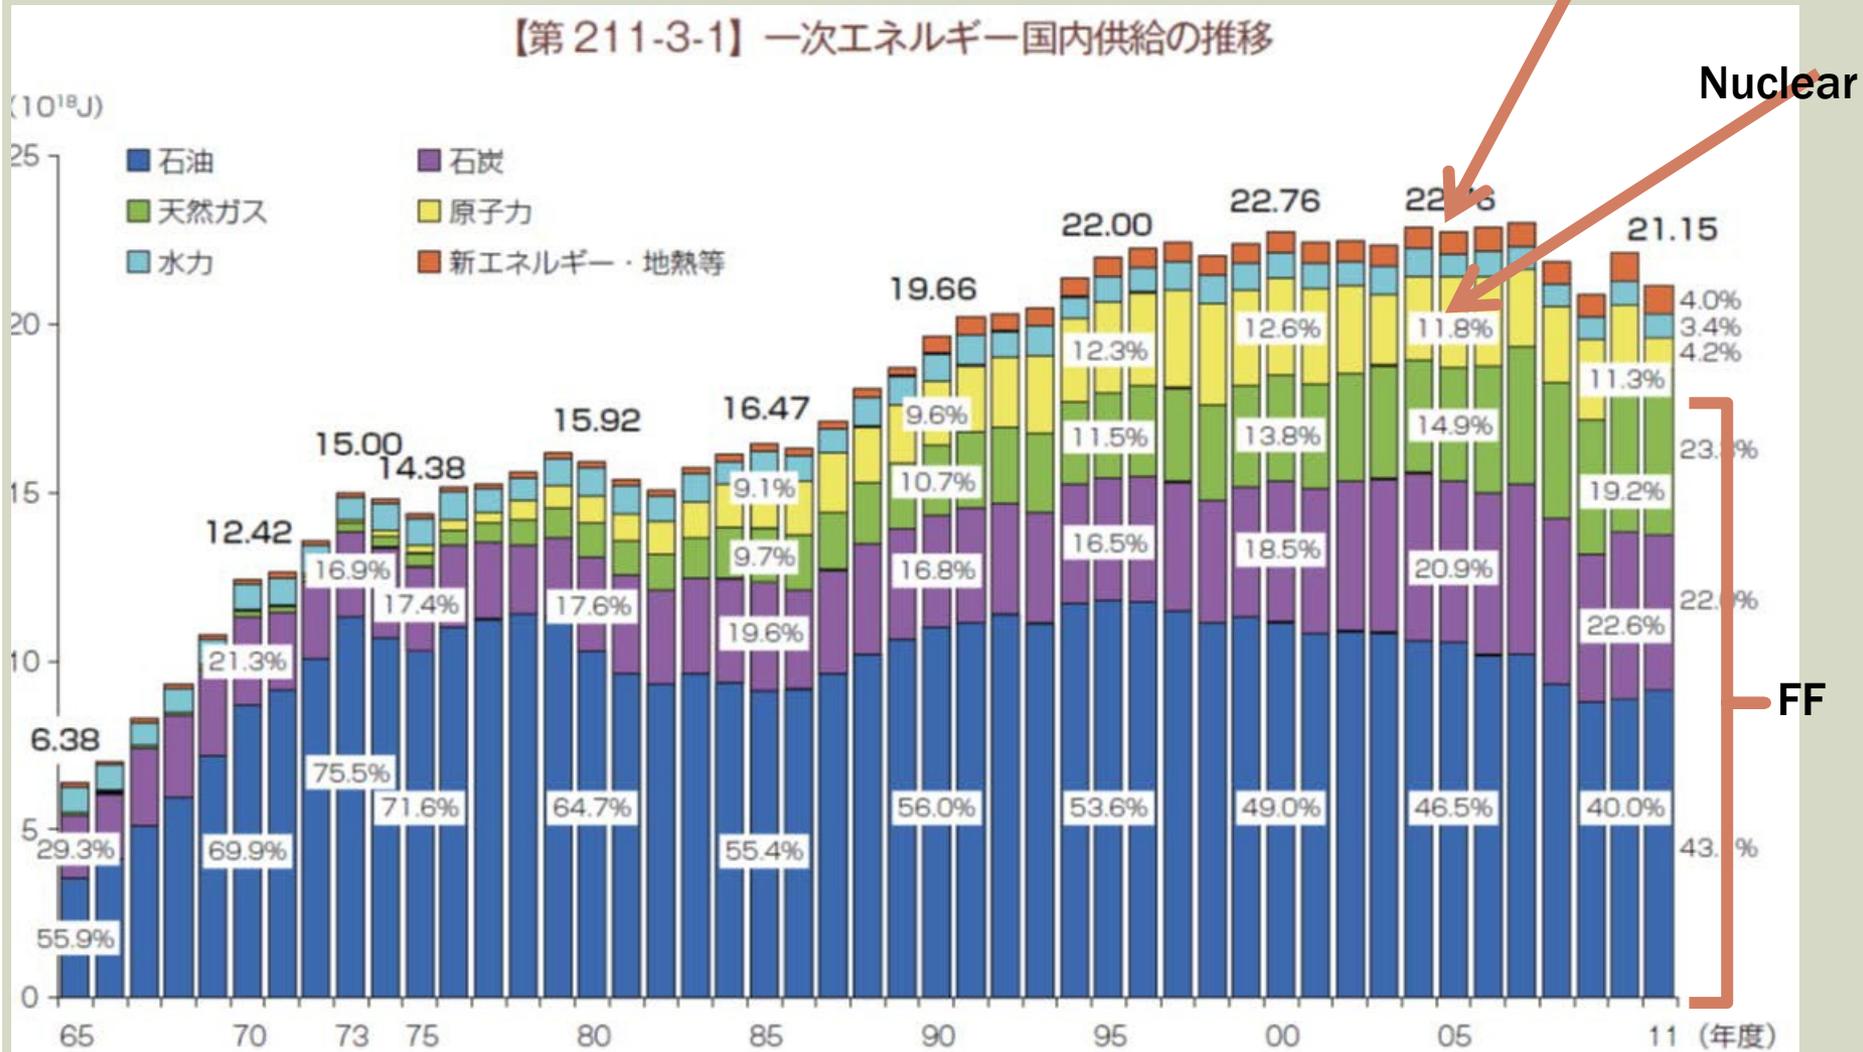

# Japan's Energy Flow before Fukushima

RE →

## Japan's energy flow before Fukushima

# Primary Energy Supply in Japan...1966-2011

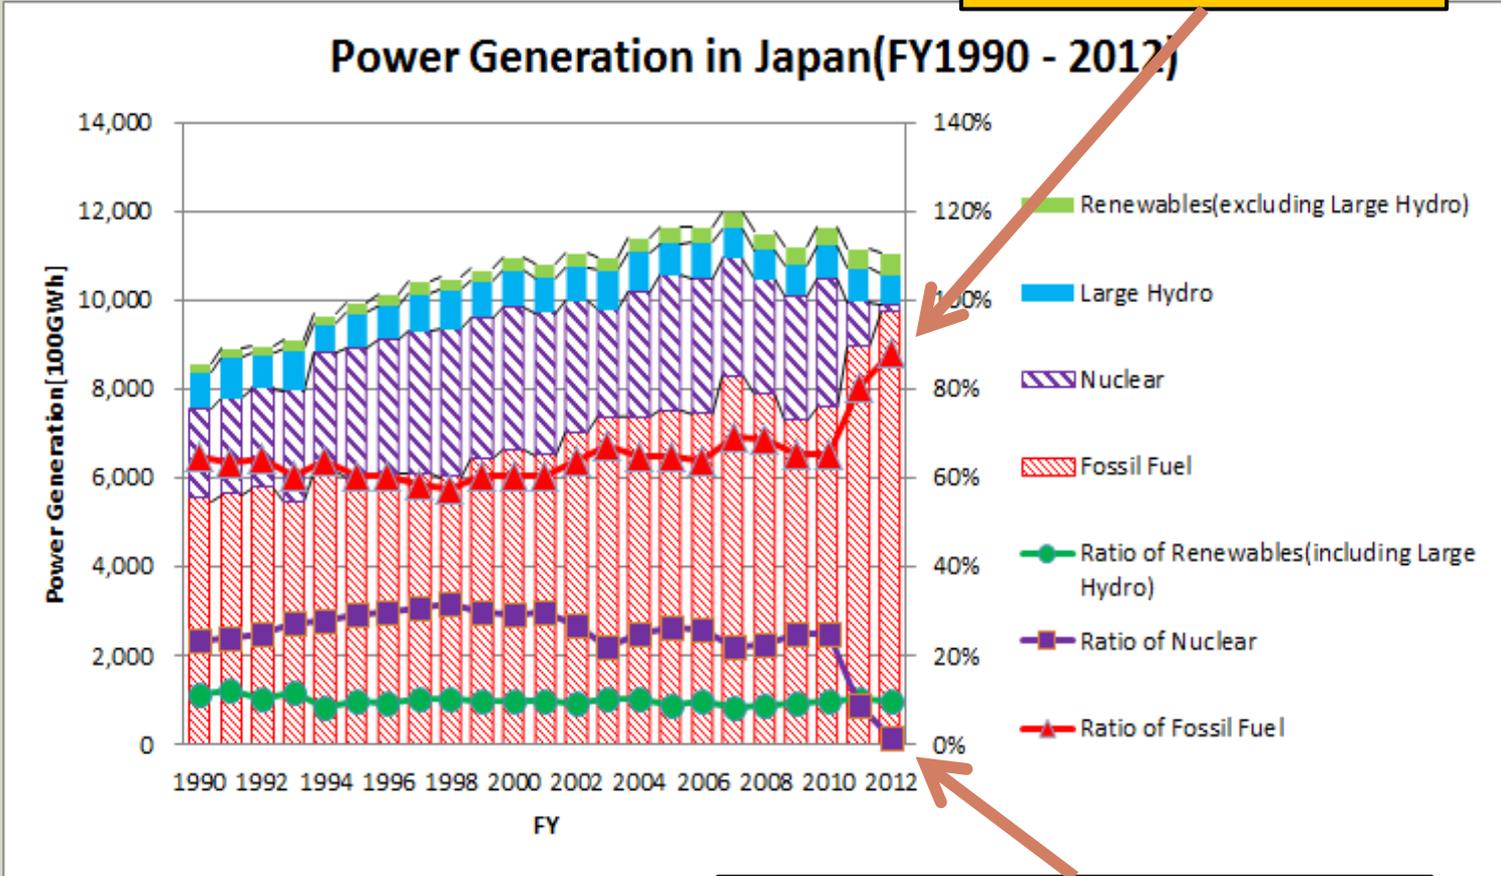

注) 「総合エネルギー統計」では、1990年度以降、数値について算出方法が変更されている。

出所) 資源エネルギー庁「総合エネルギー統計」をもとに作成。

After Fukushima, nuclear dropped to zero and fossil fuels increased dramatically ...

Fossil fuels increased

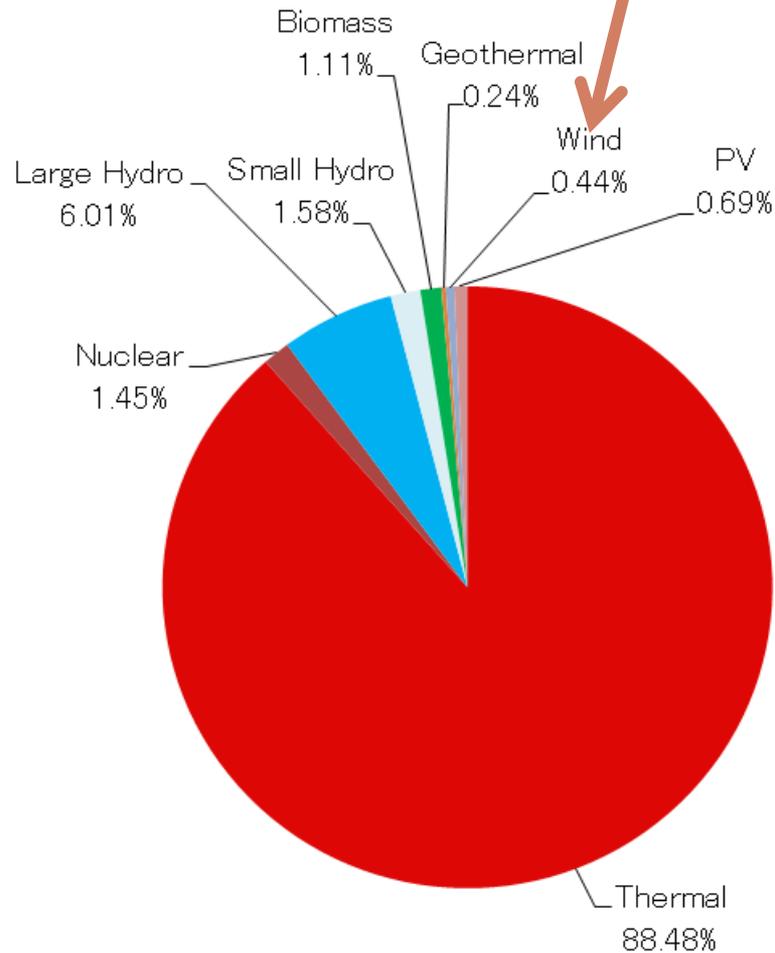

Nuclear dropped to zero in 2012

# Power Generation in Japan as of 2012

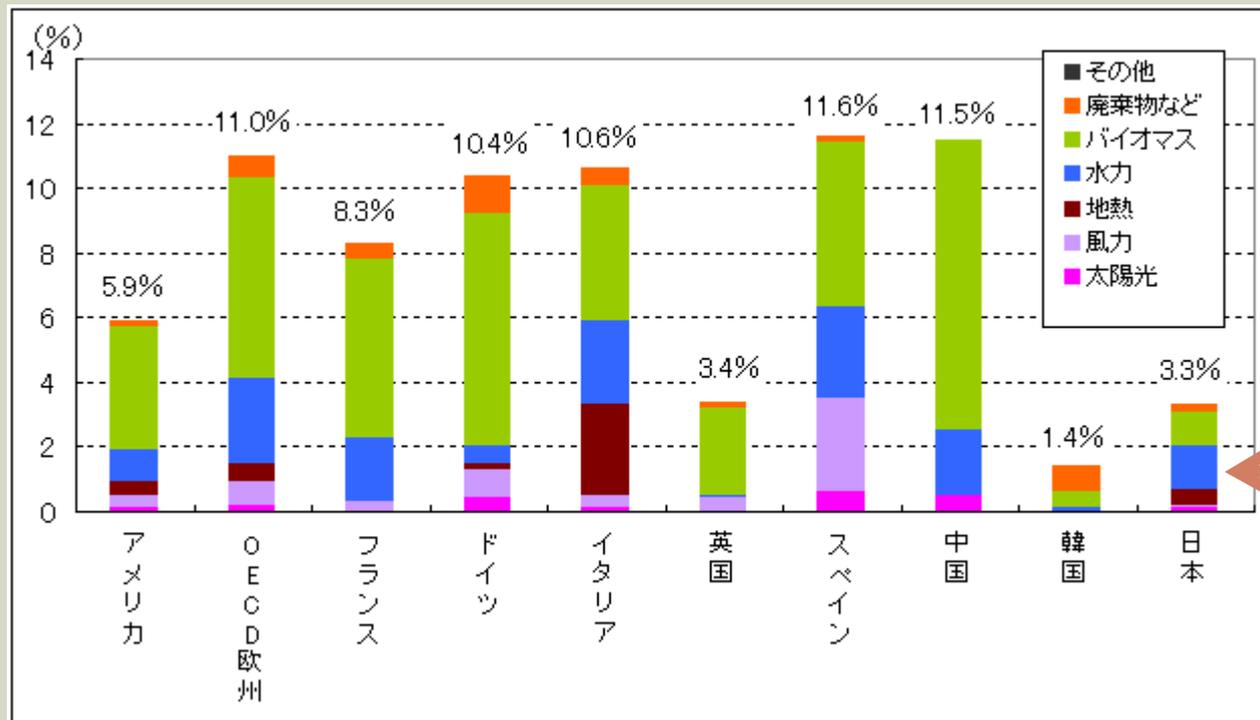

Where is wind and offshore?

## Power Generation in Japan (FY2012)

# Share of RE in total primary energy supply of major countries 2010

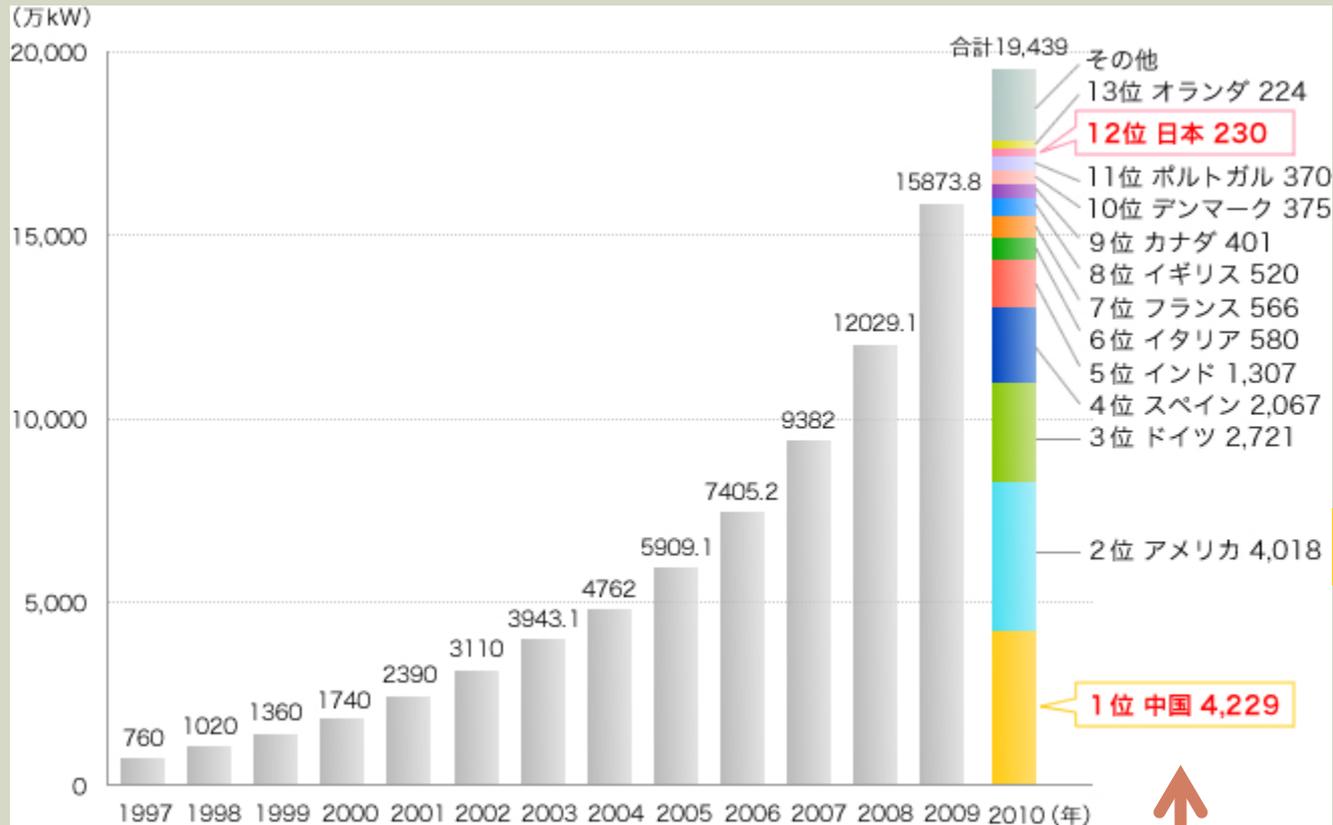

RE in Japan is small in comparison with other economies....

US EU France Germany Italy UK Spain China ROK Japan

# Cumulative installed capacity of RE by nations

China is the top runner followed by the US and European countries....  
Japan is 12<sup>th</sup> ....

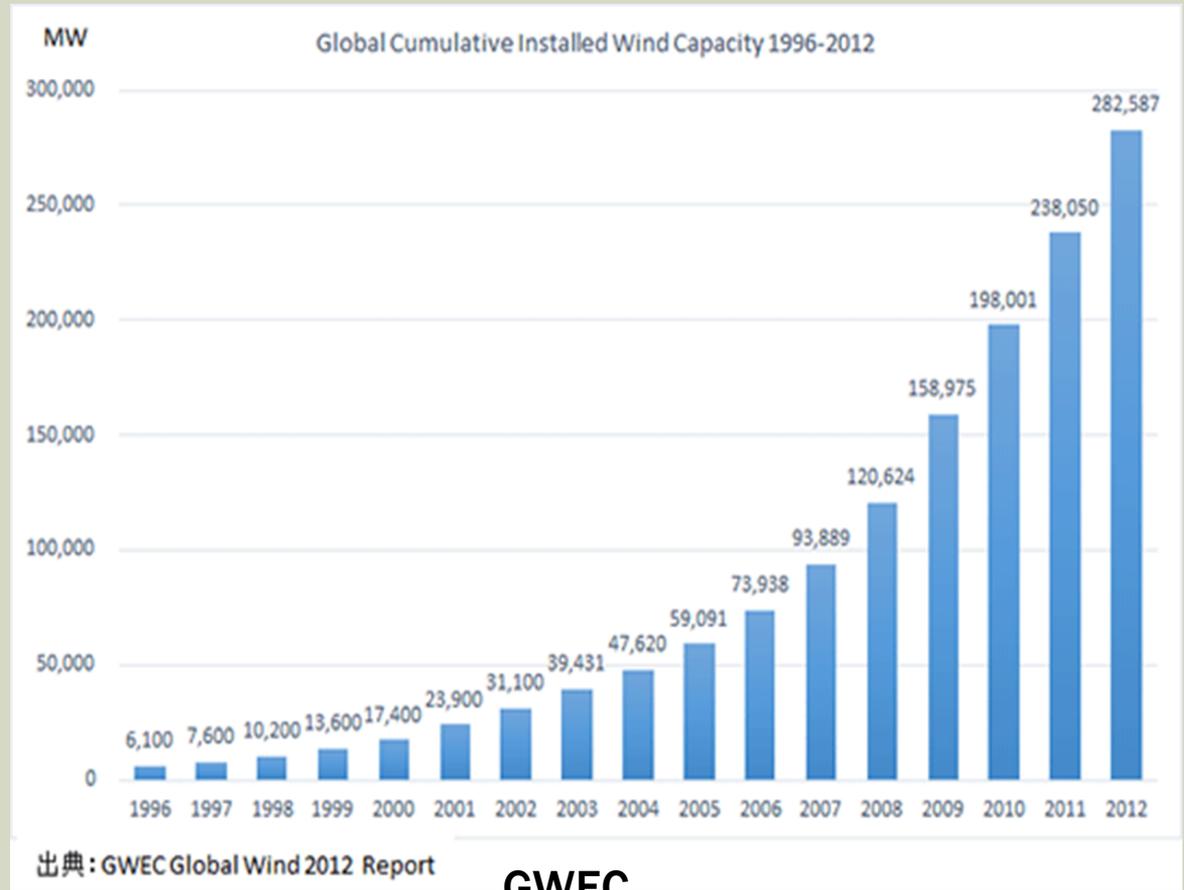

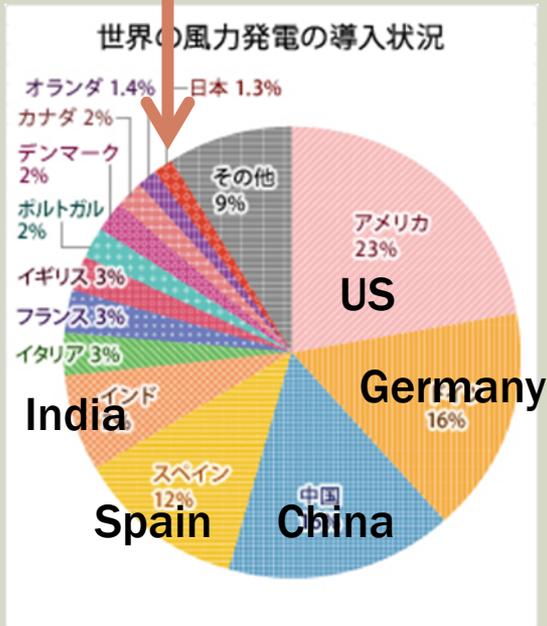

Japan No.12

US No. 2

China as number 1...

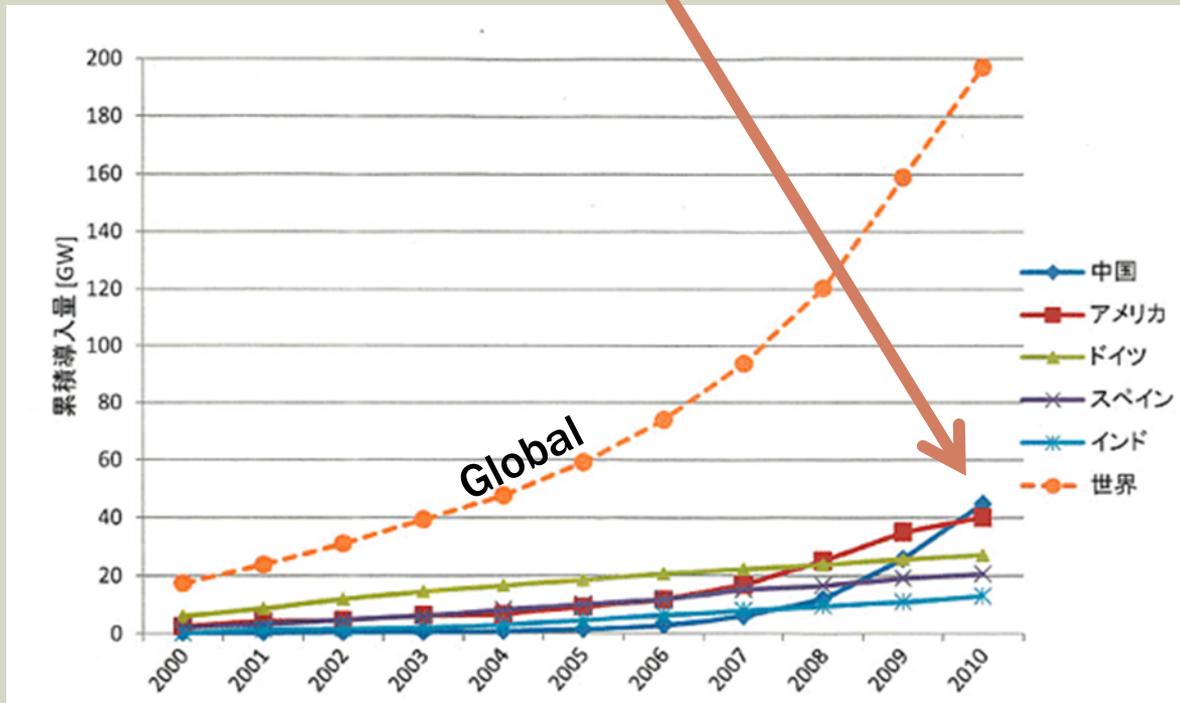

# Global Cumulative Installed Wind Capacity by 2012

Japan 1.3%

# Installed capacity of wind energy (2000-2010)

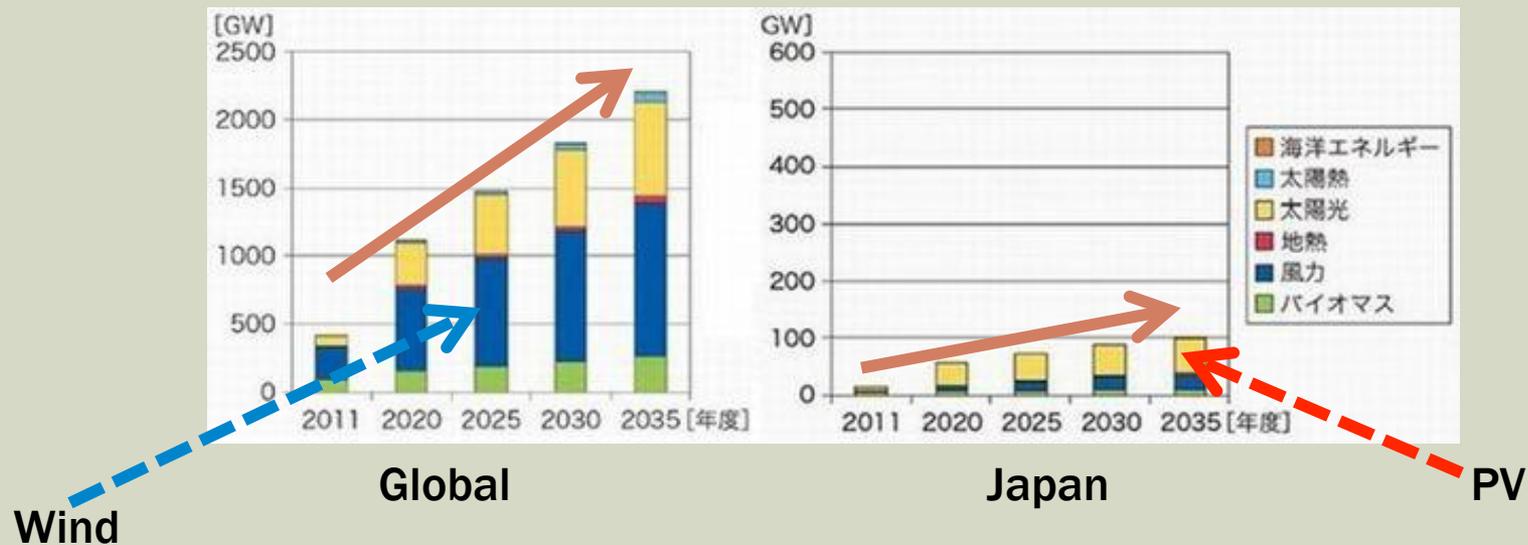

China overtaking the US in 2010....

Global Wind Report 2010, GWEC (2011)」

# RE projected installations toward 2035... World and Japan

Japan's projection is far modest than IEA's global projection...

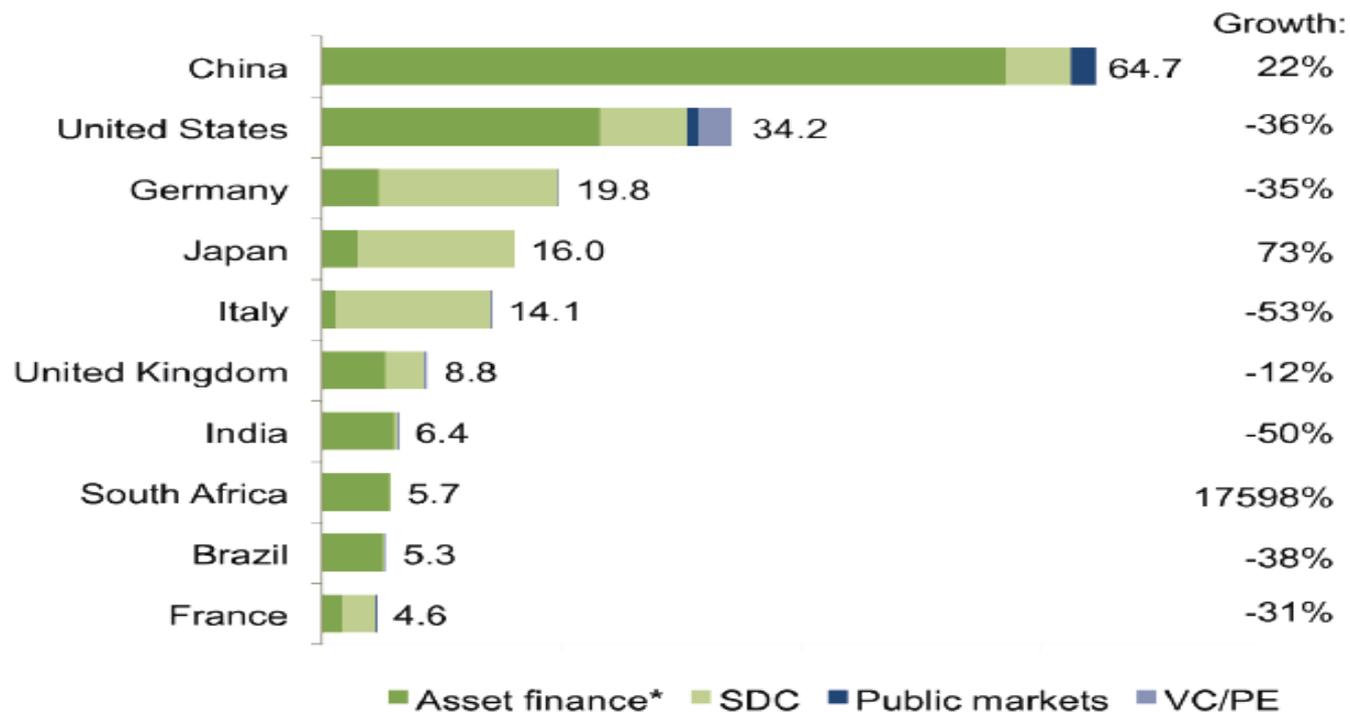

Another point: Wind (blue) is being mainstreamed globally but PV (yellow) is dominant force in Japan...

# Investment in RE: different picture...Japan is doing its best...

Investment in Japanese market was mostly on solar panels for houses. (2012)

**FIGURE 14: NEW INVESTMENT IN RENEWABLE ENERGY BY COUNTRY AND ASSET CLASS, 2012, AND GROWTH ON 2011, \$BN**

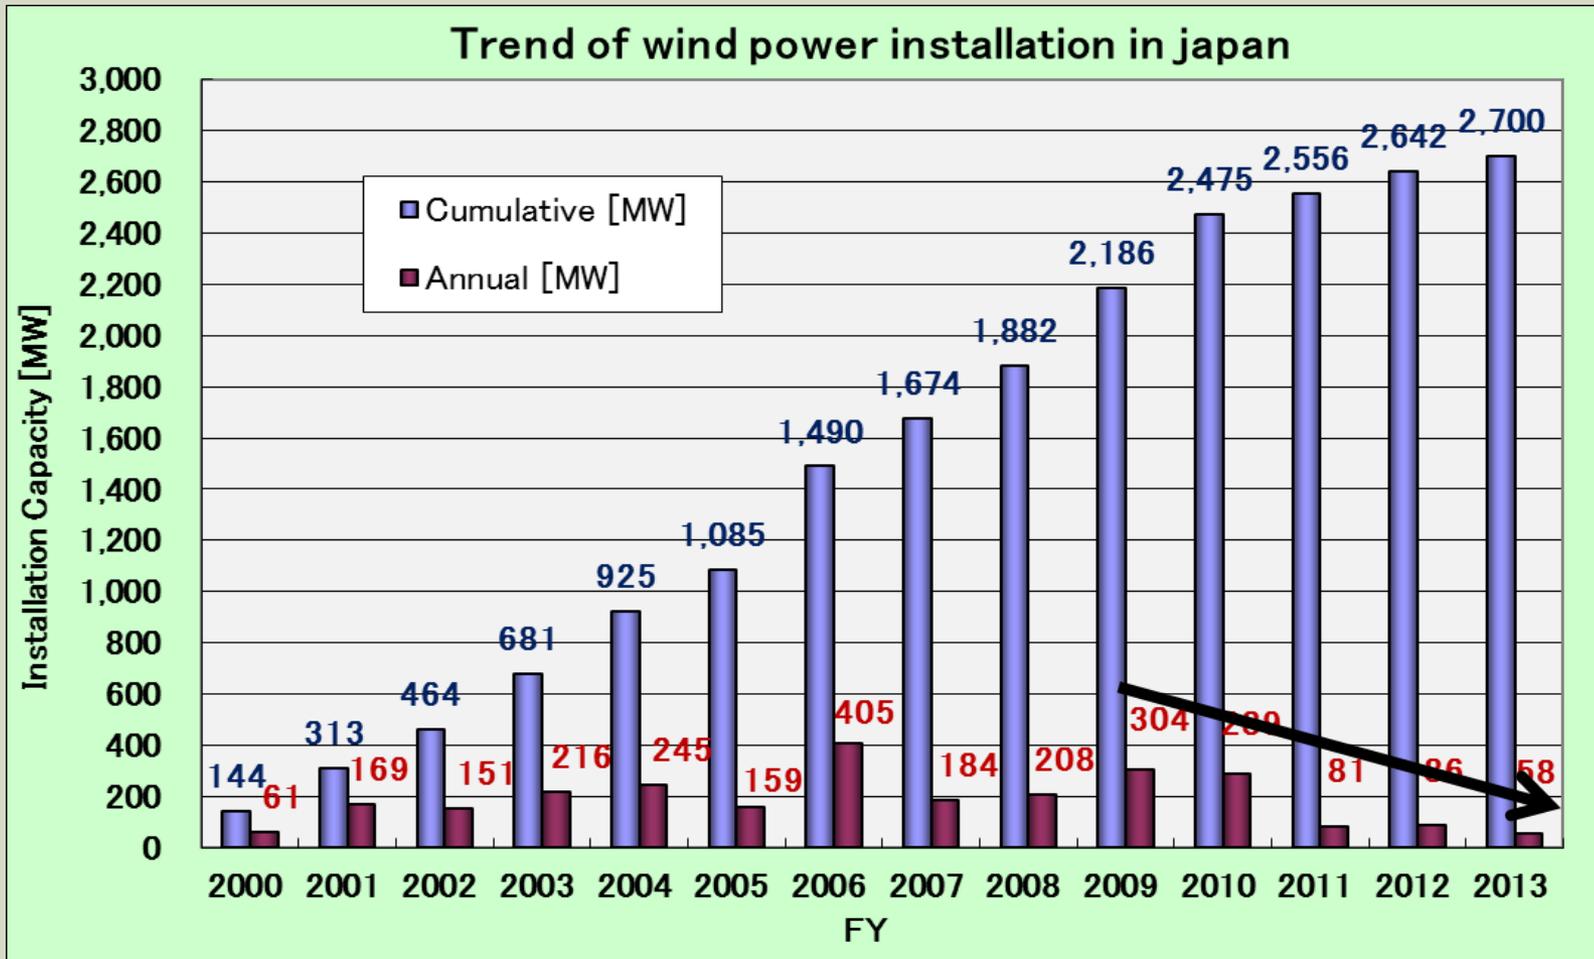

Top 10 countries. \*Asset finance volume adjusts for re-invested equity. Excludes corporate and government R&D

Source: UNEP, Bloomberg New Energy Finance

# Japan's installed wind capacity 2000-2013

Recent annual decline is due to scarcer onshore locations for wind mills...  
Offshore must be new solutions as FIT for offshore wind starting from 2014

# Japan as a maritime nation....since centuries ago...

# Japan's Exclusive Economic Zone (EEZ) is the sixth largest in the world ....

# Projections for offshore wind in Japan is getting bigger....

## Theoretical potential....

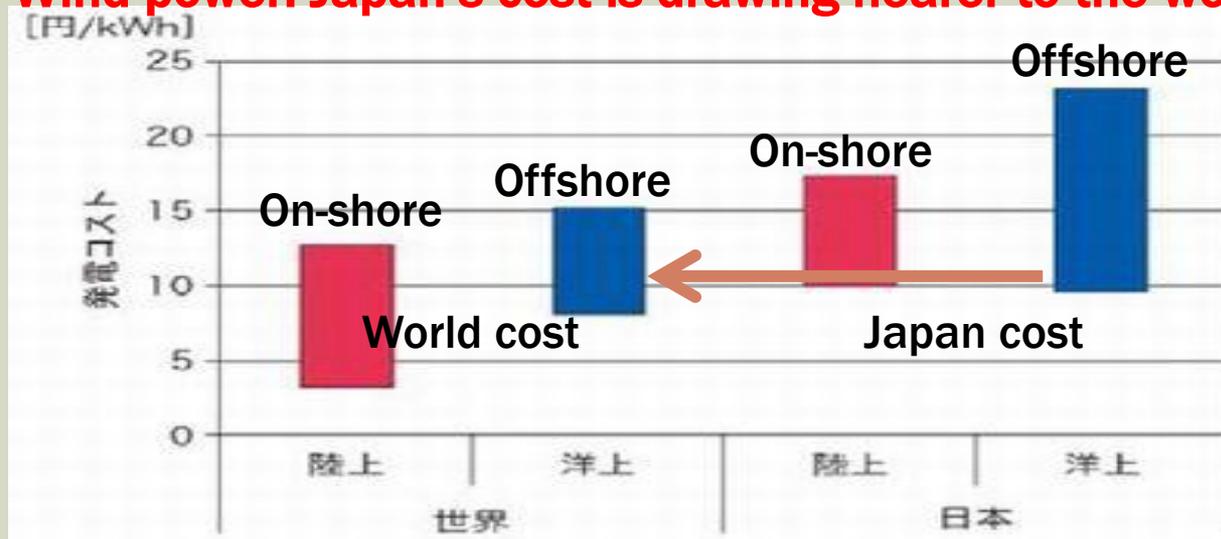

**Known theoretical potential =1,600GW(\*) which is equal to...**

- ▶8 times current entire electricity output of Japan (200GW)
- ▶10 times current global wind electricity output (158GW)
- ▶600 times current wind capacity of Japan (2.5GW)

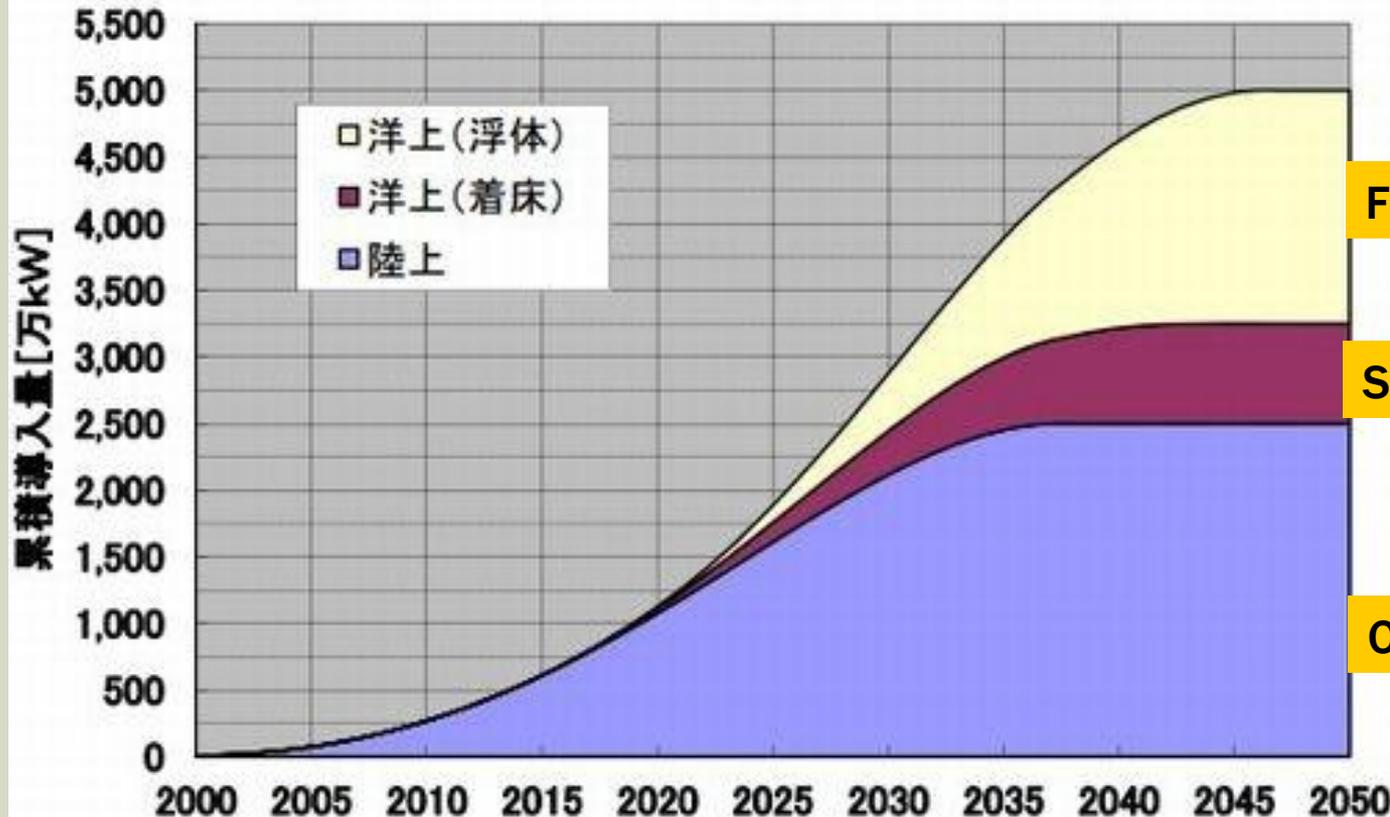

(\*) Prof. Ishihara of Tokyo University

## Cost wise....

**Wind power: Japan's cost is drawing nearer to the world cost...**

# Japan's business forecast for offshore installations by 2050

Floating structures

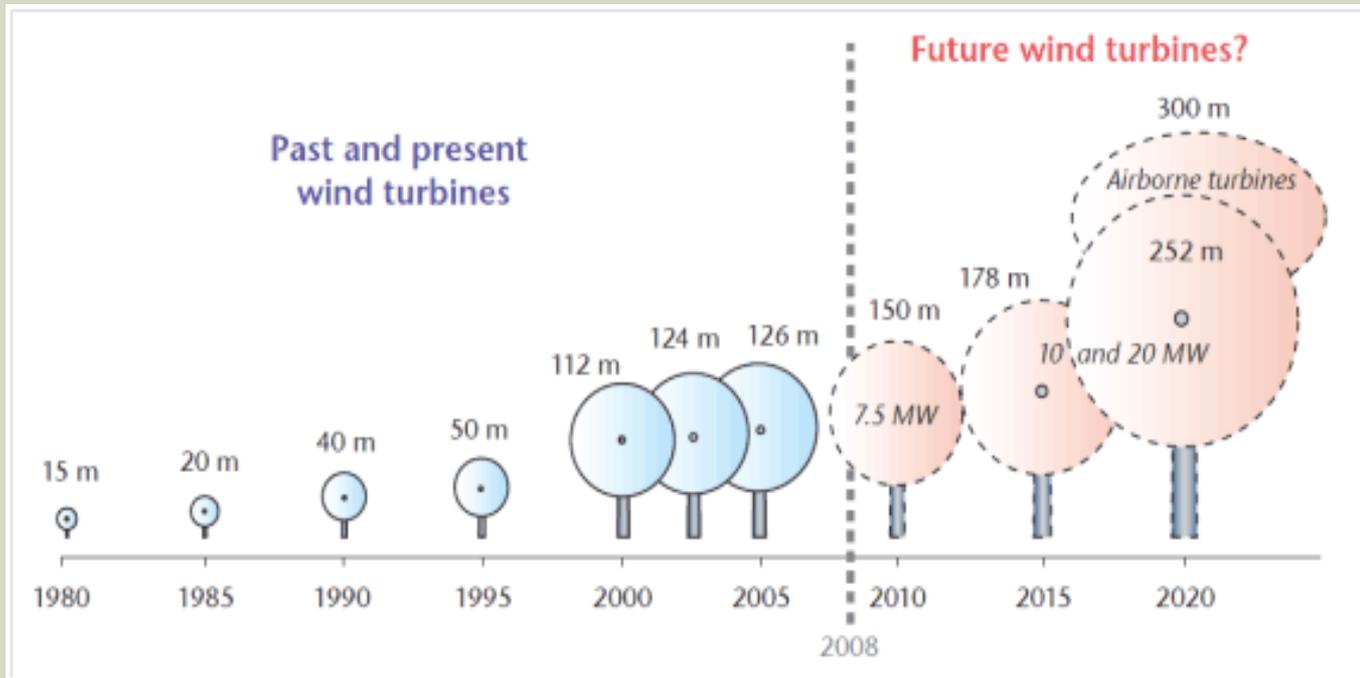

Sea bed structures

Onshore

	Offshore	Onshore	Total
2010			2.4
2020	0.5	10	11.3
2030	7.6	21	28.8
2040	21.2	25	46
2050	25	25	50

Unit: GW

# New trend in global competition... Going to deeper water and turbines getting bigger....

**The trend is an opportunities for Japanese technologies which have gone to deep sea due to its natural circumstances...**

# Projections for wind power in Japan

## Prospects are positive

### Projections....

Starting from a tiny 2.4 GW, Japan's business sector (JWPA) projects:

**11GW (2020), →29GW (2030), →46GW (2040) →50GW (2050)**  
**50GW will represent 10% of total electricity production of Japan in 2050**

### For this to happen, Japan needs;

- continued FIT needing \50/KWh going beyond current \36
  - grid connection and power fluctuation control
  - de-regulations
  - R&D investment
- And many other things...

**Offshore wind is more promising simply**  
**because the country is tiny but its sea is large...**

## Positive perspective for offshore wind in Japan Floating structures in deep seas are the future...

### **Despite difficulties due to:**

deep sea bed, strong ocean currents, typhoons, earthquakes, etc.  
and lack of grid connections

### **New perspectives are emerging since...**

–Market trends moving into deeper waters with bigger mills in Europe...  
this is where Japanese industries are investing...big scale floating mills  
7MW output with 167m blade aiming at 10MW

–Oil pressure drive train: less trouble prone than direct driving system, no gear box  
which tends to breakdown... enabling the off-shore turbines of larger capacities...

### **It's getting cost beneficial...FIT plus many factors...**

“...10 years ago, no business leaders paid any attention to the offshore wind turbine...”  
(Prof. Ishihara of Tokyo University)

<http://www.nedo.go.jp/content/100546658.pdf>

# Fukushima Offshore Wind Power Project ... a project not to be done without Fukushima...

The first phase (2013-2014):

- one 2MW floating wind turbine,
- the world first 25MVA floating substation
- undersea cable

The second phase (2014-2015)

- two world largest 7MW wind turbines on V shape semi-sub floater

**Fukushima FORWARD” promises to boost Fukushima recovery and trigger a new national drive to large-scale offshore wind mills...**

<http://www.fukushima-forward.jp/pdf/pamphlet3.pdf>

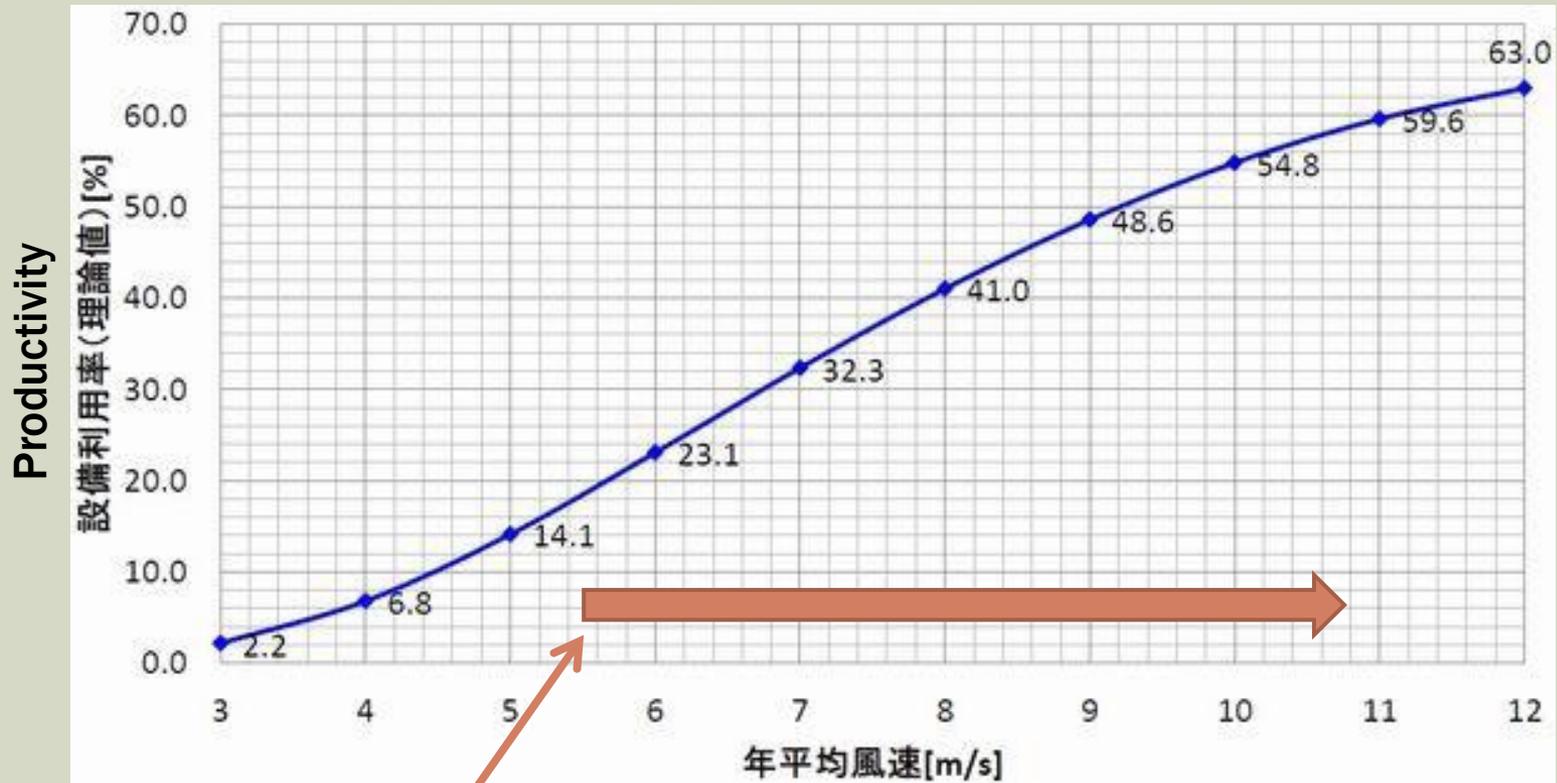

<http://www.fukushima-forward.jp/Fukushima Forward Consortium HP>

<https://www.youtube.com/watch?v=k-TGHnkss8Y>

<https://www.youtube.com/watch?v=-nbhhRto-JE>

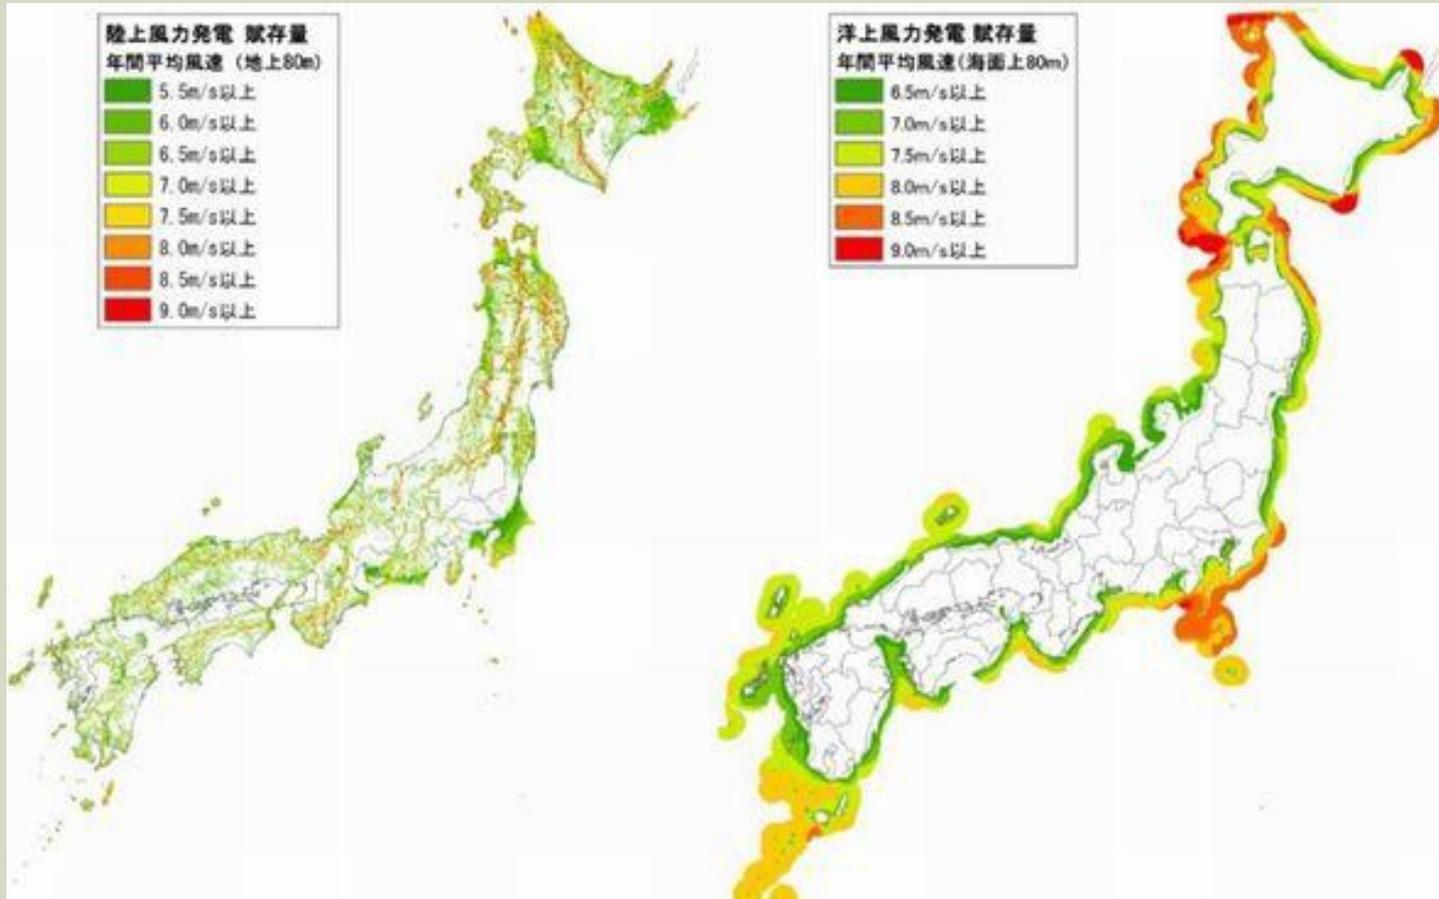

# Stronger wind allows higher productivity of wind mills

Annualized mean wind speed

The minimum wind speed required for power generation is 5.5–6 meters per second...

# How Japan is endowed with enabling wind for power generation...

Onshore areas with 5 m/s or more

Offshore areas with 6 m/s or more

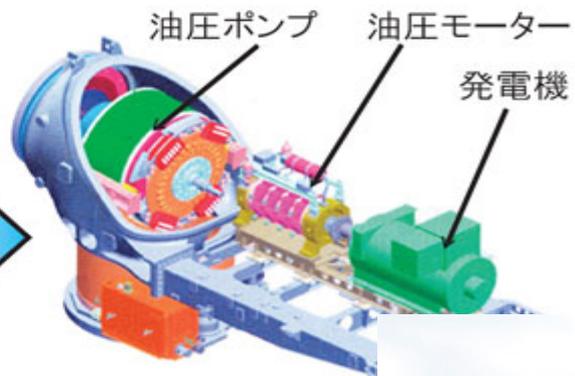

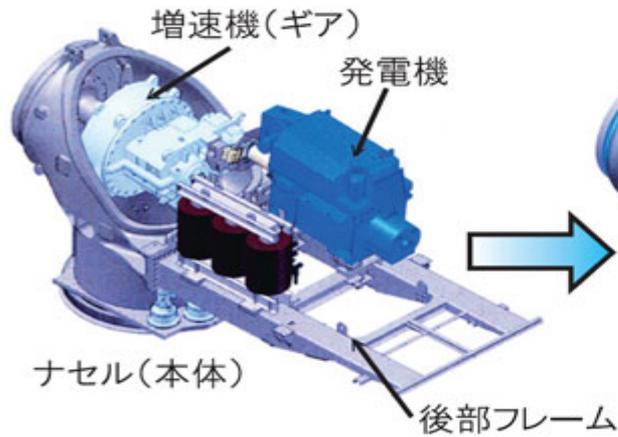

# Oil Pressured Drive Train

## Conventional gear box

## Oil pressure drive train

ギア式風車

油圧ドライブ式風車

# **New maritime resources development: a new avenue for creative development of marine resources...**

**Actions carried forward by Japan Marine Environmental Creation**

## **New maritime resources development through CO<sub>2</sub> fixation based on algae's photosynthesis**

**High speed, high efficient and massive algae culture in gigantic offshore platforms to produce:**

- biofuels and bio-chemical products**
- rare earths and medical products**
- food, fertilizers etc**
- fertile fishing grounds**
- temperature difference power generation (OTEC)**
- wave activated power generation**
- power generation from tidal wave**
- hydrogen production**

## “Marine Resources Development” growing into a new smart city concept

Integrating multipurpose mega-floats with onshore communities creating a new “smart city concept” that can thrive with...

- ▶ distributed clean electricity
- ▶ clean energy supply
- ▶ value added productions through maritime resources
- ▶ innovations triggered
- ▶ job created
